# ELECTROSTATES

## # Properties of charges -

- Basic property of matter
- charge without mass can not exist whereas mass without charge can exist.
- \* - Quantization of charge -  
charge on a body can only exist in the form of 'e'

$$Q = ne \quad (n = \text{integer})$$

- \* - charge is additive in nature

$$Q_{\text{net}} = q_1 - q_2 + q_3 - q_4$$

$$\begin{matrix} q_1, -q_2 \\ q_3, -q_4 \end{matrix}$$

- \* - conservation of charge - charge on an isolated system can neither be created nor, destroyed.  
Total charge of a system = const.

NOTE →  $\leftarrow \oplus \quad \oplus \rightarrow$ ,  $\leftarrow \ominus \quad \ominus \rightarrow$ ,  $\oplus \rightarrow \leftarrow \ominus$

- Minimum possible charge  $e = 1.6 \times 10^{-19} \text{ C}$  (quanta)
- Exception of quantisation -

quark  
→ up  $(+\frac{2e}{3})$   
→ down  $(-\frac{e}{3})$

$$\begin{aligned} \left[ \begin{aligned} 2u + 1d &= 1 \text{ particle} \\ 2(+\frac{2e}{3}) + 1(-\frac{e}{3}) &= +e \\ 1u + 2d &= 1 \text{ neutron} \\ (\frac{2e}{3}) + 2(-\frac{e}{3}) &= \text{zero} \end{aligned} \right] \end{aligned}$$

- quark particle don't exist independently, so quantisation is still correct.
- \* - If quark particle would exist even then quantisation would be valid quanta will be  $(e/3)$ .
- In a conductor charge is distributed at outer surface only while in non-conductor charge is distributed inside the surface.

## # METHOD OF CHARGING -

- ii) → Friction -  
 $\oplus$ ve ⇒ glass rod, dry hair, cat skin, wool.  
 $\ominus$ ve ⇒ silk, comb, Ebonite, plastic/Amber.
- Ex → cloud charging, charging of oil drop in miliken oil drop experiment.

- iii) → conduction -  
 \* For  $\oplus$ ve charge will move [High → Low]  
 \*  $\ominus$ ve charge will move [Low → High]

- \* NOTE ⇒ In conduction total charge of system is re-distributed in the ratio of radius for making potential same.
- \* After conduction potential become same while charges will differ.

- iiii) → Induction - takes place in facing layer only.

$$Q_{\text{Induced}} = Q_{\text{Inducing}} \left( 1 - \frac{1}{\epsilon_r} \right) \quad (\epsilon_r \rightarrow \text{dielectric const. of body})$$

- \* For metal ( $\epsilon_r = \infty$ ) →  $Q_{\text{Induced}} = Q_{\text{Inducing}}$
- \* For Non-metal ( $\epsilon_r \neq \infty$ ) →  $Q_{\text{Induced}} < Q_{\text{Inducing}}$ .
- \* Best method of charging.

- NOTE** →
- \* Induction affect the distribution of charge not the magnitude of charge.
  - \* There will be attraction b/w neutral charge body.
  - \* There will be attraction b/w body having charge of same nature provided that magnitude of charges will be different.
  - \* Sure test of charging is repulsion not attraction.

EX → How will the force ~~on~~ on  $q_1$  will change if an insulated rod is kept b/w them as shown?

Ans → Force will ↑

### # COLUMB'S LAW -

$q_1 \xleftarrow{\quad} \xrightarrow{\quad} q_2$   
 $F \propto \frac{1}{r^2}, F \propto \frac{q_1 q_2}{r^2}$

$$F = \frac{k q_1 q_2}{r^2}$$

$k = 9 \times 10^9 \text{ (MKS)}$   
 $k = 1 \text{ (cgs)}$

\* If the distance in discussion is very large as compared with the dimension of charge, it is treated as point charge.

$$|\vec{F}_{21}| = |\vec{F}_{12}| = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{q_1 q_2}{r^2}$$

$\epsilon_0 \rightarrow$  permittivity of vacuum or, free space  $= 8.85 \times 10^{-12} \frac{C^2}{N \cdot m^2}$

$$k = \frac{1}{4\pi\epsilon_0} = 9 \times 10^9$$

### III NOTE

\* If the charges are kept in some other medium, permittivity  $= \epsilon_0 \epsilon_r$   
 $\epsilon_r =$  Relative permittivity or, dielectric const. of medium will ↓

$$|\vec{F}_{net}| = \left( \frac{1}{4\pi\epsilon_0 \epsilon_r} \right) \frac{q_1 q_2}{r^2}$$

\* Coulomb's law follow principle of superposition.

$$\vec{F}_{3net} = \vec{F}_{31} + \vec{F}_{32}$$

### AJMS

### \* PERMITTIVITY [E]

- Permittivity of vacuum ( $\epsilon_0$ )  $\Rightarrow \epsilon_0 = 8.85 \times 10^{-12} C^2 / N \cdot m^2$
- Permittivity of medium  
Absolute permittivity of medium (E)  
unit  $\rightarrow C^2 / N \cdot m^2$
- $\epsilon_r = \frac{E}{\epsilon_0}$

$$1 \leq \epsilon_r < \infty$$

$(\epsilon_r)_{air} = 1$   
 $(\epsilon_r)_{metal} = \infty$

$$F_{vacume} = \frac{1}{4\pi\epsilon_0} \times \frac{q_1 q_2}{r^2}$$

$$F_{medium} = \frac{1}{4\pi\epsilon_0 \epsilon_r} \times \frac{q_1 q_2}{r^2}$$

$$\therefore F_{medium} = \frac{F_{vacume}}{\epsilon_r}$$

$$\because \epsilon_r > 1$$

$$\Rightarrow F_{net} < F_{vacume}$$

11) → case

If Fair = Fmedium

$$\frac{1}{4\pi\epsilon_0} \cdot \frac{q_1 q_2}{r_{air}^2} = \frac{1}{4\pi\epsilon_0 \epsilon_r} \cdot \frac{q_1 q_2}{r_{med}^2}$$

$$r_{air}^2 = \epsilon_r r_{med}^2$$

$$r_{air} = \sqrt{\epsilon_r \cdot r_{med}}$$

12) → case

$$F_{\text{partial medium}} = \frac{1}{4\pi\epsilon_0} \times \frac{q_1 q_2}{\left\{ (r-t) + t\sqrt{\epsilon_r} \right\}^2}$$

Imp concept  
IIT

There should be third charge  $q_3$  placed in b/w, so that net force on all the charges become zero, Also find value of  $q_3$ .

$$x = \frac{d\sqrt{q_1}}{\sqrt{q_1+q_2}} = \frac{d}{\left(1 + \sqrt{\frac{q_2}{q_1}}\right)}$$

$$q_3 = \frac{-q_1 q_2}{(\sqrt{q_1} + \sqrt{q_2})^2}$$

\*\*\*\*\*  
concept  
#

Two identical charge simple pendulum are in equilibrium as shown in fig. (Given  $\theta$  = small)

iii) → calculate Repulsion b/w ball

$$\tan\theta = \frac{kq^2}{x^2 mg}$$

$$x = \left\{ \frac{2kq^2 l}{mg} \right\}^{1/3}$$

2016 AIPMT AIEEE 2012  
iii) → If charge of ball start to leave at const. rate & ball are moving towards each other with velocity (v) then Relation b/w  $x$  &  $v$ ?

$$q^2 \propto x^3 \quad \left| \quad \frac{dq}{dt} \propto \frac{3}{2} x^{1/2} \frac{dx}{dt} \right. \quad \text{AIPMT 2016}$$

$$v \propto x^{-1/2}$$

iiii) → If  $q_1 < q_2 \Rightarrow \theta_1 = \theta_2$  (due to Action Reaction pair).

liv) → If  $M_1 > M_2 \Rightarrow \theta_1 < \theta_2$  ( $M_1$  is heavy so it will displace less so angle less)

vi) → If this system is carried in space or, Artificial satellite. [ $g=0$ ]

- \* Separation b/w ball =  $l + l = 2l$
- \* Angle b/w string =  $90^\circ + 90^\circ = 180^\circ$
- \* Electric force b/w both =  $F_e = \frac{kq^2}{(2l)^2} = \frac{kq^2}{4l^2}$
- \* Tension in each string =  $F_e = \frac{kq^2}{4l^2}$

JIPMER 2016

# If we want to give charge on ball in due to Repulsion ~~not~~ string become horizontal or,  $180^\circ$  then the value of  $q$  = ?

$$T = \frac{kq_1 q_2}{(2l)^2}, \quad q = \sqrt{\frac{4l^2 mg}{k}}$$

$$q = \sqrt{\frac{4l^2 T}{k}}, \quad T = mg$$

2012 AIEEE

vi) → If this system is dipped into the liq & angle of string with verticle remain unchanged find dielectric cost. of liq. (density =  $1.6 \text{ g/cm}^3$ , density liq =  $0.8 \text{ g/cm}^3$ )

$$\epsilon_r = \frac{1}{1 - \frac{d}{db}} = \frac{1}{1 - \frac{0.8}{1.6}} = \frac{1}{\frac{1.6 - 0.8}{1.6}} = \frac{1}{\frac{0.8}{1.6}} = \frac{1}{\frac{1}{2}} = 2$$

concept

Two identical balls each with density  $\rho$  are suspended with a common point by two insulating strings of equal length. Both the balls have equal mass & charge. In equilibrium the string makes an angle  $\theta$  with vertical. Now the whole system is immersed in liquid with density  $\sigma$ . If angle  $\theta$  does not change, what is dielectric const of liquid.

$$\epsilon_r = \frac{\rho}{\rho - \sigma}$$

concept

Three identical small balls each with mass  $m$  are suspended at one point by threads of length  $l$ . What charges should be imparted to the balls for each thread to form an angle  $30^\circ$  with the vertical.

$$q = l \sqrt{\pi \epsilon_0 m g}$$

concept

A small charge  $+q$  is distributed uniformly on an insulating ring of Radius  $R$ . If an additional charge  $+Q$  is kept at centre, find increment in tension of in Ring.

$$T = \frac{k Q q}{2 \pi R^2}$$

continuous charge distribution:

i) Linear charge density ( $\lambda$ )  $\rightarrow$  charge per unit length.

\* If distribution is uniform  $\rightarrow \lambda = \frac{q}{l}$

\* If distribution is non uniform  $\Rightarrow \lambda = \frac{dq}{dx}$  or,  $\frac{dq}{dl}$

$$dq = \lambda dx$$

ii) Surface charge density ( $\sigma$ )  $\rightarrow$  charge per unit area.

\* If distribution is uniform  $\rightarrow \sigma = \frac{q}{A}$

\* If the distribution is non-uniform  $\rightarrow \sigma = \frac{dq}{dA}$

$$dq = \sigma dA$$

iii) Volume charge density ( $\rho$ )  $\rightarrow$  charge per unit volume.

\* If  $\rho$  is uniform  $\rightarrow \rho = \frac{q}{V}$

\* If  $\rho$  is non-uniform  $\rightarrow \rho = \frac{dq}{dv}$  or,  $dq = \rho dv$

ELECTRIC FIELD INTENSITY ( $E$ )  $\Rightarrow$  It represents strength of effect of charge at given point.

\* Electric field due to point charge:

$$|\vec{F}_p| = \left( \frac{1}{4 \pi \epsilon_0} \right) \frac{(+Q)(1C)}{r^2} = |\vec{E}|$$

$$|\vec{E}| = \left( \frac{1}{4 \pi \epsilon_0} \right) \frac{Q}{r^2} \frac{N}{C} \text{ or } \frac{V}{m}$$

$$E = \frac{kQ}{r^2}$$

**NOTE** → \* When electric field is measured due to a point charge ( $q$ ), the test charge taken very small & another definition can be given as

$$|\vec{E}| = \lim_{q_0 \rightarrow 0} \frac{|\vec{F}|}{q_0}$$

\* Direction of Electric field: -

⊕ve charge = Away from the charge ( $E = \frac{kq}{r^2}$ )

⊖ve charge = Towards the charge ( $E = \frac{kq}{r^2}$ )

\* If there are several no of charges in the system then, net Electric field is vector sum of all Electric field due to charges. (principle of superposition)

\* If a charge ' $q$ ' is kept in a external Electric field  $\vec{E}$ , then net force acting on  $q$  is  $\vec{F} = q\vec{E}$

[Along  $\vec{E}$ , If  $q \rightarrow \oplus$ ve]  
[Opp  $\vec{E}$ , If  $q \rightarrow \ominus$ ve]

## # ELECTRIC FIELD DUE TO CONTINUOUS CHARGE DISTRIBUTION: →

**CASE I** → Due to uniformly charge Ring of Radius ' $R$ ' at the centre: -

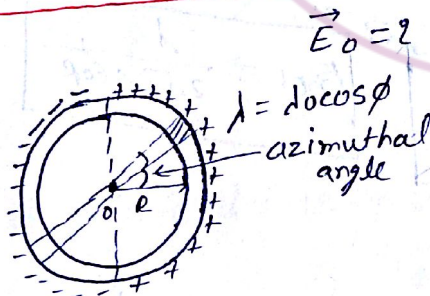

$$|\vec{E}_0| = \frac{1}{4\pi\epsilon_0 R} \frac{dq}{R^2}$$

**CASE II** → Due to Semi-circular Ring at the centre: -

$$\vec{E}_{net} = \frac{q}{2\pi^2\epsilon_0 R^2} = \frac{\lambda}{2\pi\epsilon_0 R}$$

\*\*

$$E = \frac{\lambda_0}{2\epsilon_0 R}$$

$$E_{net} = 2E = \frac{\lambda_0}{4\epsilon_0 R}$$

**CASE III** → Due to uniformly charged circular Ring along its axis: -

$$E_{res} = \frac{1}{4\pi\epsilon_0} \frac{q x}{(R^2 + x^2)^{3/2}}$$

- \* At centre ( $x=0$ )  $E=0$
- \* Near by point ( $x \ll R$ )  $E = \frac{kqx}{(R^2)^{3/2}} = \frac{kqx}{R^3} \propto x$
- \* Far away point ( $x \gg R$ )  $E = \frac{kq}{x^2} \propto 1/x^2$
- \* For  $E_{max} = \frac{dE}{dx} = 0 \Rightarrow x = \pm R/\sqrt{2}$

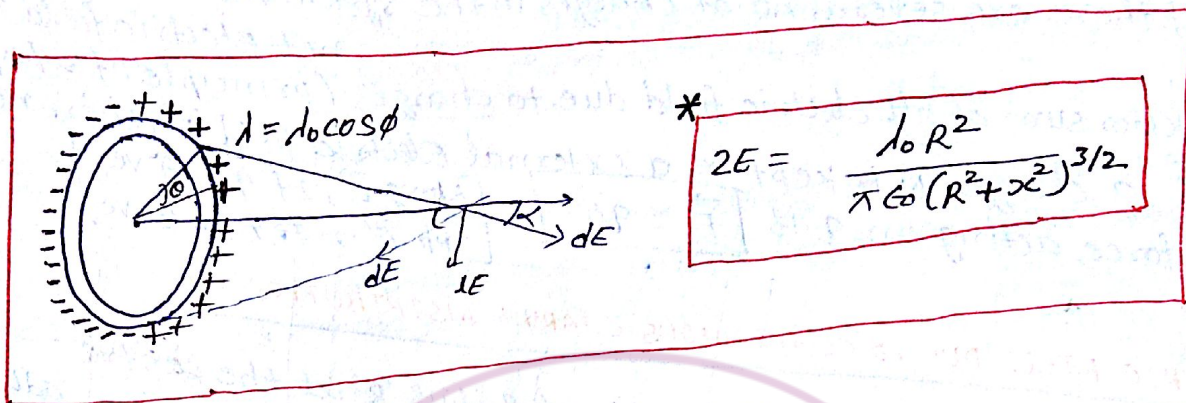

NOTE →

\* Max<sup>m</sup> electric field along axis

$$\frac{dE}{dx} = 0 \Rightarrow x = \frac{R}{\sqrt{2}}$$

\*

case IV → Due to infinite line charge having uniform charge density ( $\lambda$ ) :-

$$E_{net} = \frac{\lambda}{2\pi\epsilon_0 R}$$

case V → Due to semi-infinite line charge having uniform density ' $\lambda$ '

$$E_1 = \int_0^\infty dE \cos\theta = \frac{\lambda}{4\pi\epsilon_0 R}$$

$$E_2 = \int_0^\infty dE \sin\theta = \frac{\lambda}{4\pi\epsilon_0 R}$$

case VI →  $\vec{E}$  Due to finite line charge :-  
 $E_p = ?$

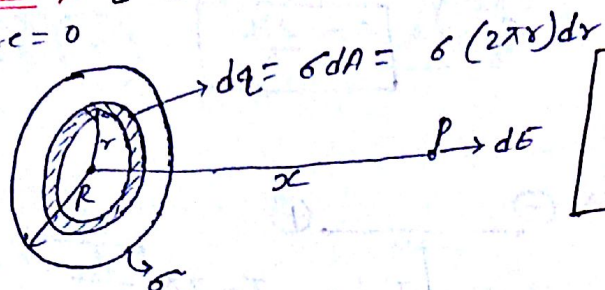

$$E_y = \frac{\lambda}{4\pi\epsilon_0 x} (\sin\beta + \sin\alpha)$$

$$E_x = \frac{\lambda}{4\pi\epsilon_0 y} (\cos\beta - \cos\alpha)$$

Case VII  $\Rightarrow \vec{E}$  due to circular DISC uniformly charge With  $(\sigma)$  :-

$\vec{E}_{\text{centre}} = 0$

$$\vec{E} = \frac{\sigma x}{2\epsilon_0} \left[ \frac{1}{x} - \frac{1}{\sqrt{R^2 + x^2}} \right]$$

NOTE  $\rightarrow$

$$E = \frac{\sigma}{2\epsilon_0} \left[ 1 - \frac{1}{\sqrt{1 + \frac{R^2}{x^2}}} \right]$$

If  $R \rightarrow \infty$

$$\vec{E} = \frac{\sigma}{2\epsilon_0}$$

For infinitely distributed plane sheet.

\* After folding the Rings, net electric field will  $\uparrow$ .

\*\*\*

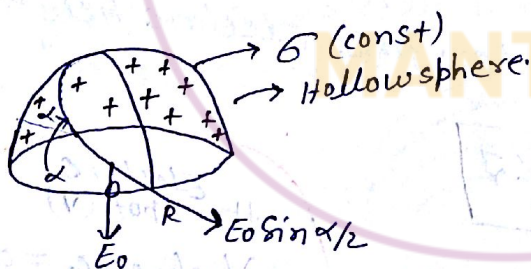

Case VIII  $\Rightarrow \vec{E}$  at centre due to uniformly charged hemi-spherical shell :-

$$E = \frac{\sigma}{4\epsilon_0}$$

EX  $\rightarrow$  Find  $\vec{E}$  due to part which is cut at an angle  $\alpha$ .

\* Electric field due to uniformly charge wire -

$$E = \frac{2K\lambda}{r}$$

\*  $\vec{E}$  centre for uniformly charged arc :-

III  $\rightarrow$

$$E = \frac{2K\lambda}{r} \sin\left(\frac{\alpha}{2}\right)$$

iii)  $\alpha = 90^\circ$   $E = \frac{\sqrt{2} K \lambda}{r}$   $\alpha = 180^\circ$   $E = \frac{2 K \lambda}{r}$   $\alpha = 360^\circ$   $E = 0$

\* Pendulum concept :-

$T = 2\pi \sqrt{\frac{l}{g_{eff}}}$   
 $(g_{eff} = \text{accln for net force except tension})$

$T = 2\pi \sqrt{\frac{l}{g_{eff}}}$   
 $T = 2\pi \sqrt{\frac{l}{g + \frac{qE}{m}}}$

$F_{net} = \sqrt{(mg)^2 + (qE)^2}$   
 $g_{eff} = \sqrt{g^2 + \left(\frac{qE}{m}\right)^2}$   
 $T = 2\pi \sqrt{\frac{l}{\sqrt{g^2 + \left(\frac{qE}{m}\right)^2}}}$

# Potential difference (PD) :- It is independent of reference so it is absolute parameter.  
 $PD = -\int \vec{E} \cdot d\vec{r}$  (If  $E$  is uniform / non-uniform)  
 $PD = -\vec{E} \cdot d\vec{r}$  (If  $E$  is uniform)

# Relation b/w  $E$  &  $V$  :- Electric field is due to potential diff & it is equal to  $\ominus$ ve of potential gradient.

Type I -> If pot. is function of ' $r$ ' then find Electric field :-  
 If  $V = f(r) \Rightarrow E = ?$

$E = -\frac{dV}{dr} \quad \vec{E} = -\frac{dV}{dr} \hat{r}$

Type II -> If  $V = f(x, y, z) \Rightarrow E = ?$

$\vec{E} = -\nabla V$   
 $\nabla \rightarrow$  Del operator (Gradient)  
 $\nabla = \frac{i\partial}{\partial x} + \frac{j\partial}{\partial y} + \frac{k\partial}{\partial z}$

$\vec{E} = -\left[\frac{i\partial V}{\partial x} + \frac{j\partial V}{\partial y} + \frac{k\partial V}{\partial z}\right]$

Type III -> If  $V$ - $r$  graph is given at  $E = ?$

$E = -\frac{dV}{dr} \quad E = -\text{slope}$

# Electric pot (V)

$V_{reference} = 0$

$V_{location} = 0$

$V_{earth} = -0.12 V$

$V_{earth} = 0$  (consider zero)

$\text{slope} = \frac{y_2 - y_1}{x_2 - x_1}$   
 $E = -\text{slope}$

Type IV → If  $E = f(r) = PD = ?$

$$PD = -\int \vec{E} \cdot d\vec{r}$$

Type V → If  $E = f(x, y, z) \Rightarrow PD = ?$

$$PD = \int \vec{E} \cdot d\vec{r}$$

$$= - \int (E_x i + E_y j + E_z k) \cdot (dx i + dy j + dz k)$$

$$= - \int E_x dx - \int E_y dy - \int E_z dz$$

Type VI → If  $E \cdot r$  graph is given

$$PD = \left| - \int \vec{E} \cdot d\vec{r} \right|$$

= Area under the curve.

# Electric line of forces or, Electric field lines:-

We know that electric field is invisible to generate the picture of Electric field, we draw Electric line of forces.

properties of ELF →

iii → Tangent drawn at a point on the line of forces gives the direction of field at that point.

ii → Two electric field lines can never intersect as there will be two direction of Electric field at that point.

iii → conservative Electric field lines can never form close loop.

iv → The density of electric field lines in a certain region gives us a qualitative idea about the strength of field in that region.

v → They are always perpendicular to equipotential surface.

vi → If the positive charge at rest is free to move then it may or, may not follow the line of forces.

vii → Electric lines are differentiable at all point they can't have sharp turnings.

viii → Electric field lines can be discontinuous.

Isolated +ve charge originates at charge & end at infinity.

Isolated -ve charge originates at ∞ & end at +ve charge.

AIEEE  
2015

Infinite plane  
Sheet of charge

An Electric field is switched on at  $t=0$  as shown.

1a) → amplitude of oscillation \*

$$Kx = qE$$

$$x = \frac{qE}{K}$$

1b) → Time period of oscillation.

$$T = 2\pi \sqrt{\frac{m}{K}}$$

## # ELECTRIC POTENTIAL ENERGY (U): -

Defined for conservative field only.

\* point charge → PE = zero

\* If we consider displacement  $\vec{dr}$  at position vector  $\vec{r}$

$$dW_{\text{cons}} = \vec{F} \cdot \vec{dr}$$

$$\left( \vec{F} = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Qq}{r^2} \cdot \vec{r} \right)$$

$$U = \frac{Qq}{4\pi\epsilon_0 r}$$

NOTE

iii) →  $Q, q$  are kept along with sign as If  $Q, q$  both are of same sign

$W_{\text{ext}} = \oplus \text{ve}$  ,  $U = \oplus \text{ve}$  (unstable)

\* AS If  $Q, q$  are of opp. sign

$W_{\text{ext}} = \ominus \text{ve}$

$U = \ominus$  (stable)

iii) → If there are 'n' no. of point charges then the total energy of the system is the sum of potential energies due to all these pairs.

Ex →

$$U = k \left[ \frac{q_1 q_2}{r_{12}} + \frac{q_2 q_3}{r_{23}} + \frac{q_3 q_1}{r_{31}} \right]$$

iiii) → If there are 'n' no. of charges (point) in the system then no. of pair =  $\boxed{nC_2}$

iv) → External Work done in assembling of a system of charges =  $U_{\text{system}}$ .

Work done in disassembling a system of charges =  $-U_{\text{system}} =$   
= Binding Energy of system.

**ELECTRIC POTENTIAL (V)** → Work done on an unit  $\oplus$ ve charge in displacing it from A to B.

$$V_{AB} = V_B - V_A = \frac{W_{\text{ext}}}{q_0} = \frac{V_B - V_A}{q_0}$$

$$= (\text{pot. of B} - \text{pot. of A})$$

**NOTE** → \* It is scalar quantity ( $\oplus$ ve, zero,  $\ominus$ ve)

\* unit  $\frac{\text{Joule}}{\text{Coulomb}}$  or, volt.

\* While calculating potential difference charges are used along with sign.

**Absolute potential at a point** → If we bring charge  $q_0$  from infinity to a point P. then work done per unit charge become potential at P.

$$V_P = V_P - V_{\infty} = \frac{U_P - U_{\infty}}{q_0} = \frac{U_P}{q_0}$$

**Electric potential due to a system of charges** —

iii) → Due to point charge (Q) —

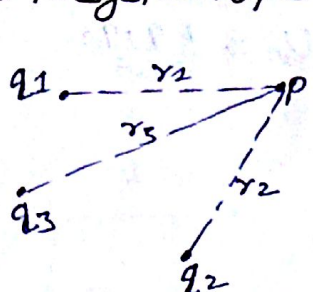

$$V_A = \frac{1}{4\pi\epsilon_0} \frac{Q}{r}$$

(Q with sign)

iii) → Due to system of several point charges -

$$V_p = \frac{1}{4\pi\epsilon_0} \left[ \frac{q_1}{r_1} + \frac{q_2}{r_2} + \frac{q_3}{r_3} \right]$$

$q_1, q_2, q_3 \Rightarrow$  With sign

Due to continuous charge distribution -

ii) → Due to circular Ring (+Q) →

|a| → At centre

$$V = \frac{kQ}{R}$$

\* (Whether this dist. is uniform or, non-uniform)

|b| → At a point on axis

$$V = \frac{kQ}{\sqrt{R^2 + x^2}}$$

\*\*\*  
iii) → Due to Finite line charge -

$$V = k \frac{dq}{x} = \int_0^{a+L} k \frac{dx}{x}$$

\* 
$$V = k \lambda \ln \left| \frac{0+L}{L} \right|$$

\*\*\*\*  
iiii) → uniformly charged disc ( $\sigma, R$ ) →

|A| → At centre

$$V = \frac{\sigma R}{2\epsilon_0}$$

|B| → At a point on the axis 'x'

$$V = \frac{\sigma}{2\epsilon_0} \left[ \sqrt{R^2 + x^2} - x \right]$$

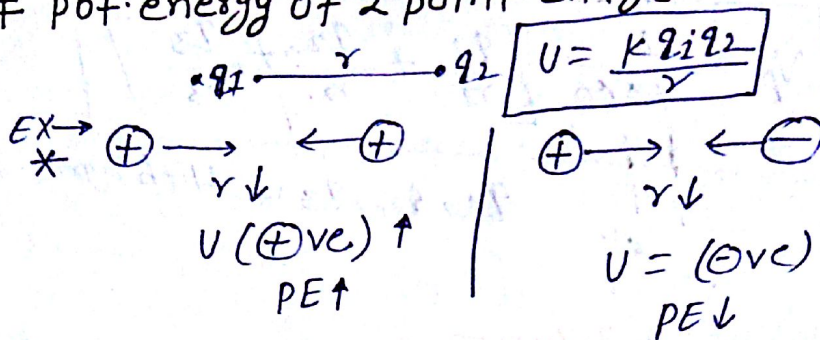

|C| → At a point on the edge of the disc -

$$V = \frac{\sigma R}{\pi\epsilon_0}$$

# pot. energy of 2 point charge.

$$U_{\infty} = \frac{kq_1q_2}{\infty} = 0$$

$$U = \frac{kq_1q_2}{r}$$

\* When two point charge are brought close to each other, then PE of system may ↑ or ↓.

# Potential energy of system having 'M' point charges - Equal to algebraic sum of PE of all possible pair of 2 charges.

$$\text{no. of pair} = \frac{n(n-1)}{2}$$

# Work done by electric field: → conservative field so it perform work then its PE ↓.

$$W_{\text{conser.}} = -\Delta U$$

$$\begin{aligned} W_{\text{electric field}} &= -\Delta U \\ &= -q(\Delta V) \\ &= -q(V_f - V_i) \end{aligned} \quad (\text{charge must use } \bar{c} \text{ sign})$$

\* Work in electric field is independent of actual path & Work for closed loop is zero.

Work Energy Relation

$$W_{\text{total}} = \Delta K.E$$

$$W_{\text{external}} + W_{\text{cons}} + W_{\text{non-cons}} = \Delta K.E$$

$$W_{\text{ext}} + W_{\text{cons}} = \Delta K.E$$

$$* W_{\text{ext}} = \Delta K + \Delta U$$

$$K.E = \text{const} \Rightarrow \Delta K.E = 0$$

$$W_{\text{ext}} = ?$$

$$W_{\text{ext}} = \Delta U$$

$$\begin{aligned} &= q\Delta V \\ &= q(V_f - V_i) \end{aligned}$$

If  $K.E \neq \text{const}$

$$W_{\text{ext}} = 0$$

$$\Delta K.E + \Delta U = 0$$

$$K + U = \text{const}$$

**PMP Sir!! SMS \*** When an  $\alpha$ -particle is projected towards a nuclei it can reach up to a closest distance, Higher the  $K.E$  of Incident  $\alpha$ -particle closer to it is to nucleus, success is life analogous to it more effort you put in closer to success.

# An  $\alpha$ -particle is thrown from with velocity 'v' towards nucleus of atomic no. 'Z' calculate closest distance of approach?

$\alpha$ -particle (+2e)

$$\text{Here } r \propto \frac{1}{m}$$

$$\& r \propto \frac{1}{v^2}$$

ATPMT  
2016

# Potential at a distance 'x' from axis :-

$x = \infty$

$$V_0 = \sqrt{\frac{qQ}{4\pi\epsilon_0 m R(n+1)}}$$

$$T = 2\pi \sqrt{\frac{R^3 \eta (n+1) m}{2kqQ}}$$

# Relation b/w  $\vec{E}$  &  $V$  :-

"displaced very slowly by Ext. agent"

$$dV_{AB} = -\vec{E} \cdot d\vec{r}$$

NOTE  $\Rightarrow$

iii  $\rightarrow$  To find potential difference b/w point A & B

$$\int_A^B dV_{AB} = - \int_A^B \vec{E} \cdot d\vec{r}$$

$$V_{AB} = V_B - V_A = \int_{\vec{r}_A}^{\vec{r}_B} \vec{E} \cdot d\vec{r}$$

iii  $\rightarrow$  To find direction & magnitude of  $\vec{E}$

$$dv = -\vec{E} \cdot d\vec{r}$$

$$dv = -E dr \cos \theta$$

$$-\frac{dv}{dr} = E \cos \theta$$

$$\left| \frac{dv}{dr} \right|_{\max} = E$$

- \* 'Electric field is always directed from a point at higher potential to the point at lower potential'
- \* 'Direction of electric field is along the line where rate of  $\downarrow$  of potential (i.e.  $-\frac{dv}{dr}$ ) is Max $_{\theta=0}$ '

# calculating potential from  $E-x$  curve

$$E_x = -\frac{dv}{dx}$$

$$\Delta V = -\int E_x \cdot dx \approx \text{Area under } E_x-x \text{ curve}$$

$$V_{AB} = V_B - V_A = -A_1$$

$$V_{BC} = V_C - V_B = +A_2$$

# Equipotential surface :  $\rightarrow$  It is the surface where  $\phi$  at every point is const. It can be spherical, cylindrical or, plane surface.  
 \* Electric field is always  $\perp$  to the equipotential surface. ( $E \perp dv$ )  
 \* Work done in moving a charge ( $\oplus ve / \ominus ve$ ) b/w two points on equipotential surface is always zero.

$$W = q(V_f - V_i)$$

$$\therefore V_f = V_i$$

$$\boxed{W = 0}$$

# Electric Flux ( $\phi$ )  $\rightarrow$  Measure of no of lines passing through a surface.

\* Flux going into the surface is considered as  $\ominus ve$  & coming out of the surface is considered as  $\oplus ve$ .

$$\boxed{d\phi = \vec{E} \cdot d\vec{s}}$$

$\vec{E}$  = Electric field intensity.

Area vector ( $d\vec{s}$ ) -

$$d\vec{s} = (ds) \hat{n}$$

$\hat{n}$  = a unit vector  $\perp$  to the small area  $ds$

\* There can be two directions of  $\hat{n}$  & theoretically we can choose any one of them but while calculating flux through a surface  $\hat{n}$  is taken towards the observer.

Hollow Hemisphere

$$\boxed{\phi_{\text{flat}} = -E\pi R^2}$$

$$\boxed{\phi_{\text{curved}} = E\pi R^2}$$

$$\boxed{\phi_{\text{total}} = 0}$$

$$\boxed{\phi_{\text{bowl}} = \frac{q}{\epsilon_0}}$$

NOTE  $\rightarrow$  \* To find electric flux either we can find area  $\perp$  to  $\vec{E}$  or, we can find component of  $\vec{E}$   $\perp$  to the given area. [remember area in a case should be plane surface.]  
 \* If a closed surface is kept in a uniform electric field or, if it does not contain any charge, the total flux passing through it is always zero.

$\vec{E}$   $\phi_{\text{total}} = 0$

## # The statement of Gauss law:-

"Net flux passing through any closed surface is equal to charge enclosed by it divided by  $\epsilon_0$ "

$$\oint \vec{E} \cdot d\vec{s} = \frac{q_{in}}{\epsilon_0}$$

Surface integral = Integration of complete surface.

### NOTE →

1a) \* Net flux is always calculated due to charges inside the surface by while integrating  $\vec{E} \cdot d\vec{s}$  the  $\vec{E}$  at the surface is due to all the charges in that system.

1b) \* With the help of Gauss law, we can find electric field due to the some charged system but they are very limited.

\* Angle b/w  $\vec{E}$  &  $d\vec{s}$  at every point on gaussian surface should be same.

\* Magnitude of  $\vec{E}$  should be same through out the surface.

\*  $\phi_{net}$  doesn't depend on size of body.

### Application of Gauss Law:-

# Electric field due to some symmetric charge distribution.

$$\oint \vec{E} \cdot d\vec{s} = \frac{q_{in}}{\epsilon_0}$$

$$\oint E ds \cos \theta = \frac{q_{in}}{\epsilon_0}$$

\* Magnitude 'E' at every point on surface must be same.

\* Angle b/w  $\vec{E}$  &  $d\vec{s}$  should same.

$$\phi = \vec{E} \cdot d\vec{s} = \oint E ds = E \oint ds = E \times 4\pi r^2$$

$$\oint \vec{E} \cdot d\vec{s} = \frac{q}{\epsilon_0}$$

$$E = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{q}{r^2}$$

Infinite line charge

$$\oint \vec{E} \cdot d\vec{s} = E \oint ds = E [2\pi r l]$$

$$= \frac{q_{in}}{\epsilon_0} = \frac{\lambda l}{\epsilon_0}$$

$$E = \frac{\lambda}{2\pi\epsilon_0 r}$$

|C| →

$$\oint \vec{E} \cdot d\vec{S} = E \oint ds = E(2A)$$

$$Q_{in} = \sigma A$$

# \* Infinite/long wire: →  $E = \frac{2K\lambda}{r}$

\* Non conducting wire →  $E = \frac{\sigma}{2\epsilon_0} \propto r^0$

\* Conducting plate →  $E_{outside} = \frac{\sigma}{\epsilon_0}$ ,  $E_{inside} = 0$

# All conducting [solid/hollow] & Hollow non conducting sphere

$\Phi_{\text{curved}} = \frac{q}{4\pi\epsilon_0} \times 2\sqrt{3}\pi = \frac{q\sqrt{3}}{2\epsilon_0}$

# CONDUCTOR

[METAL]

It has infinite no. of free  $e^-$  which can move inside the volume or, on the vol. or, on the surface if external force is applied, they can not leave conductor.

## Concept of Electrostatic Equilibrium

Suppose by some mechanism an excess charge  $+Q$  is given to a conductor.

- To gain min<sup>m</sup> energy state, all the charge come on surface of conductor.
- When all the charge come in state of rest, this equilibrium is termed as electrostatic equilibrium.
- Net force on each charge along the surface become zero.

## In State of Electrostatic equilibrium

- \* Electric field along the surface is zero as  $\vec{F}_{\text{net surface}} = 0$ .
- \* Electric potential of whole body becomes same.
- \* Electric field inside the body of conductor become zero.  
 $\boxed{\vec{E}_{\text{inside}} = 0}$
- \* It can be assumed as lowest energy state of conductor.
- \* Electric field lines start  $\perp$  from the surface of conductor at every point.

## Case I ⇒ Electric field near the surface of conductor.

- \* charge distribution may not be uniform.
- \* Surface charge density at different points will be different.

$$\oint \vec{E} \cdot d\vec{S} = E \cdot dS = \frac{q_{\text{in}}}{\epsilon_0}$$

$$E dS = \frac{\sigma dS}{\epsilon_0}$$

$$\boxed{\vec{E} = \frac{\sigma}{\epsilon_0} \vec{n}} \quad \perp \text{ to surface.}$$

case II  $\Rightarrow$  conductor left in an external electric field

AIIMS

case III  $\Rightarrow$  Conductor Having cavity :  $\rightarrow$

1a)  $\rightarrow$  Excess charge given but no charge in cavity  $\rightarrow$

$* \text{under electrostatic condition}$

$$V_{\text{conductor}} = \text{const.}$$

$$E_{\text{inside}} = 0$$

$$\oint \vec{E} \cdot d\vec{s} = \frac{q_{in}}{\epsilon_0} = \frac{q_1}{\epsilon_0}$$

$$\boxed{\vec{E} = 0}$$

$$\dots \boxed{q_{in} = 0}$$

1b)  $\rightarrow$  A point charge is kept inside the cavity  $\rightarrow$

1i)  $\rightarrow$  If no. charge given to conductor  $\rightarrow$

$$\oint \vec{E} \cdot d\vec{s} = 0$$

$$\frac{q - q_1}{\epsilon_0} = 0$$

$$\Rightarrow \boxed{q_1 = q}$$

Electric field inside cavity at a distance  $r$  from  $0$

$$\Rightarrow \boxed{E = \frac{kq}{r^2}}$$

1ii)  $\rightarrow$  If additional charge is also given to the conductor.

$$\boxed{\text{Net} = +q + q}$$

**\*\* Case IV  $\Rightarrow$  Electrostatic shielding  $\Rightarrow$  Suppose a conductor is kept in an external electric field.**

Now, suppose a point charge  $+q$  is kept at the centre of conductor

$\text{Conductor } \boxed{E_{ext} = E_0}$

AIIMS  
\*\*\*

$Q \rightarrow$  Will  $+q$  experience any force?

Ans  $\rightarrow$  If charge  $+q$  is placed inside conductor, it will not experience any kind of force, it is known as Electrostatic shielding.  
Net effect inside conductor will be only due to point charge.

**Case V  $\Rightarrow$  Solid conducting sphere or, Hollow spherical shell (uniformly charged) Electric field intensity:**

iii  $\rightarrow$  For inside point ( $r < R$ )

$$\oint \vec{E} \cdot d\vec{S} = E \cdot 4\pi r^2 = \frac{Q}{\epsilon_0}$$

$$\boxed{E_{inside} = 0}$$

iiii  $\rightarrow$  For outside point ( $r > R$ )

$$\oint \vec{E} \cdot d\vec{S} = E \times 4\pi r^2 = \frac{Q}{\epsilon_0}$$

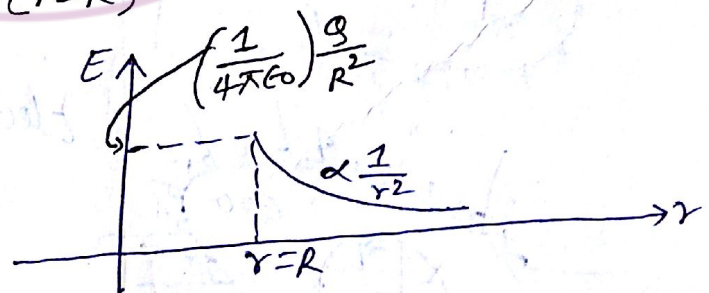

$$\boxed{E_{outside} = \left(\frac{1}{4\pi\epsilon_0}\right) \frac{Q}{r^2}}$$

AIIMS

|iii|  $\rightarrow$  on surface (just outside) ( $r = R$ )

$$\boxed{E = \left(\frac{1}{4\pi\epsilon_0}\right) \left(\frac{Q}{R^2}\right)}$$

Just inside  $\Rightarrow (r = R)$   
 $\boxed{E = 0}$

Electric potential

|a|  $\rightarrow$  For outside point ( $r > R$ )  $\Rightarrow \boxed{V = \left(\frac{1}{4\pi\epsilon_0}\right) \frac{Q}{r}}$

|b|  $\rightarrow$  For on surface ( $r = R$ )  $\Rightarrow \boxed{V = \left(\frac{1}{4\pi\epsilon_0}\right) \frac{Q}{R}}$

|c|  $\rightarrow$  For inside point ( $r < R$ )  $\Rightarrow \boxed{V = \left(\frac{1}{4\pi\epsilon_0}\right) \frac{Q}{R}}$

$= \text{const} = V_{\text{surface}}$

## # Self potential energy of conducting shell $\Rightarrow$

$$W_{ext} = \frac{kq}{2R} = \frac{q^2}{8\pi\epsilon_0 R} = U_{self}$$

EX  $\rightarrow$

$U_{system} = ?$

$$U_{system} = U_{self} + U_{interaction}$$

$$U_{self} = \frac{Q_1^2}{8\pi\epsilon_0 R} + \frac{Q_2^2}{8\pi\epsilon_0 (2R)}$$

$$U_{interaction} = \frac{1}{4\pi\epsilon_0} \left( \frac{Q_1 Q_2}{2R} \right)$$

## # Uniformly charged non-conducting solid sphere :-

i)  $\rightarrow$  Electric field ( $E(r)$ )

$$E = \frac{1}{4\pi\epsilon_0} \cdot \frac{Qr}{R^3}$$

ii)  $\rightarrow r < R$

$$\rho = \frac{Q}{\frac{4}{3}\pi R^3}$$

$$\oint \vec{E} \cdot d\vec{S} = E \cdot 4\pi r^2$$

$$Q_{in} = \rho \times \frac{4}{3}\pi r^3$$

iii)  $\rightarrow r = R$

$$E_{surface} = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q}{R^2}$$

iiii)  $\rightarrow$  For outside points whole charge of sphere can be assumed at centre. ( $r > R$ )

$$E \cdot 4\pi r^2 = \frac{Q}{\epsilon_0}$$

$$E = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q}{r^2}$$

i)  $\rightarrow$  Electric potential  $V(r) \rightarrow$

ii)  $\rightarrow r > R$  (For outside point)

$$V(r) = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q}{r}$$

iii)  $\rightarrow r = R$  (at surface)

$$V_{surface} = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q}{R}$$

iii)  $r < R$  (For inside point)

$$-\frac{dv}{dr} = E$$

$$-\int_{V_{\text{surface}}}^{V_{\text{inside}}} dv = \int_{r=R}^{r=r} E \cdot dr$$

$$V_{\text{inside}} = V_1 + V_2$$

due to point  
 $r < r$

due to point  
 $r < r < R$

$$V_1 = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Qr^3}{R^3}$$

$$V_{\text{inside}} = V_1 + V_2 = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q}{2R^3} (3R^2 - r^2)$$

$$V_{\text{centre}} = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{3}{2} \left( \frac{Q}{R} \right)$$

# |C|  $\rightarrow$  self potential energy  $\Rightarrow$

$$U_{\text{self}} = \frac{3Q^2}{20\pi\epsilon_0 R}$$

# connecting two conducting shells

$$V_A = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q_1}{R_1}$$

$$V_B = \left( \frac{1}{4\pi\epsilon_0} \right) \frac{Q_2}{R_2}$$

$$Q_1 = \frac{Q_1}{4\pi R_1^2}$$

$$Q_2 = \frac{Q_2}{R_2^2}$$

$$Q_1 R_1 = Q_2 R_2$$

$$Q \propto \frac{1}{\text{radius of curvature}}$$

It is clear that at sharp edges surface charge density become too high.

$$\sigma = \frac{1}{\text{radius of curvature}}$$

AIIMS

!! \*\* → If Electric field just outside the conductor become greater than  $3 \times 10^6 \text{ V/m}$ , break down of air molecule near conductor start which is commonly known as 'Corona Discharge' (Ionisation of air molecules)

# Potential calculating in conducting shells

$$V_A = \frac{1}{4\pi\epsilon_0} \left( \frac{Q_1}{R_1} + \frac{Q_2}{R_2} + \frac{Q_3}{R_3} \right)$$

$$V_B = \frac{1}{4\pi\epsilon_0} \left( \frac{Q_1}{R_2} + \frac{Q_2}{R_2} + \frac{Q_3}{R_3} \right)$$

$$V_C = \frac{1}{4\pi\epsilon_0} \left( \frac{Q_1 + Q_2 + Q_3}{R_3} \right)$$

NOTE →

- \* By convention potential of earth is assumed to be zero.
- \* Two points which are earthed can be connected by conducting wire. ( $V = \text{const} = 0$ )
- \* The point or body connected to earth can receive or send desired charge accordingly charge conservation law will not hold.

$$V_A = \frac{kQ}{R} + \frac{k(Q-Q)}{R} = 0 \Rightarrow Q_1 = 0$$

\*\*\*

$$V_{\text{sphere}} = V_{\text{centre}}$$

$$= \frac{kQ}{r} - \frac{kQ_1}{R} = 0$$

$$Q_1 = \frac{QR}{r}$$

\* At a point on dipole axis  $\rightarrow$

$$V = \frac{1}{4\pi\epsilon_0} \frac{p}{r^2}$$

\* At a point on equatorial axis  $\rightarrow$

$$V = 0$$

NOTE → Dipole as in form of components

Case IV →

Electric field due to

|a| →  $p \cos \theta$

$$\vec{E}_r = \frac{1}{4\pi\epsilon_0} \frac{2p \cos \theta}{r^3} \hat{r}$$

|b| →  $p \sin \theta$

$$\vec{E}_\theta = \frac{1}{4\pi\epsilon_0} \frac{p \sin \theta}{r^3} \hat{\theta}$$

$$\tan \beta = \frac{E_\theta}{E_r}$$

$$E_{res} = \sqrt{E_r^2 + E_\theta^2}$$

NOTE ⇒ In case of polar co-ordinate system, relation b/w  $\vec{E}$  &  $V$  can be given by

$$\vec{E} = - \frac{\partial V}{\partial r} \hat{r} - \frac{1}{r} \frac{\partial V}{\partial \theta} \hat{\theta}$$

Case V ⇒ Net force & torque acting on dipole kept in uniform external  $\vec{E}$ .

$$\vec{F}_{net} = 0$$

calculating  $\vec{\tau}$  about centre of mass

$$\tau = 2 (qE \sin \theta) a \quad \left| \quad \begin{aligned} \tau &= pE \sin \theta \\ \tau &= \vec{p} \times \vec{E} \end{aligned} \right.$$

Case VII  $\Rightarrow$  oscillation of Dipole in uniform  $\vec{E} \rightarrow$

Linear oscillation

$$\omega = \sqrt{\frac{k}{m}}$$

Angular oscillation

$$\omega = \sqrt{\frac{k}{I}}$$

$$\tau = -PE \sin \theta$$

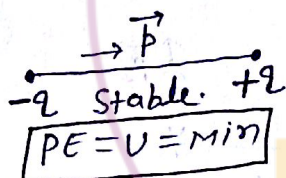

$\therefore \theta$  is very small

$$\sin \theta \approx \theta$$

$$\text{Time period} = T = 2\pi \sqrt{\frac{I}{PE}}$$

$$I = ml^2 + ml^2 = 2ml^2$$

Case VIII  $\Rightarrow$  PE of a dipole in uniform External field:  $\rightarrow$

$$U_{\min} < U < U_{\max}$$

Work done on dipole in rotating it from stable position is stored in the form of PE of dipole.

suppose from general position  $\theta = \theta$ ; dipole is rotated very slowly through an angle ' $d\theta$ '

$$U = -PE \cos \theta$$

$$U = -\vec{p} \cdot \vec{E}$$

If dipole is rotated from  $\theta = \theta_1$  to  $\theta = \theta_2$  work done by ext agent =  $W_{\text{ext}} = U_f - U_i$

$$W_{\text{ext}} = PE (\cos \theta_1 - \cos \theta_2)$$

Case VIII  $\Rightarrow$  Electric dipole in non-uniform electric field  $\rightarrow$

$$\text{Net force} = F = q(dE) = q(dx) \left( \frac{dE}{dx} \right)$$

$$F = p \left( \frac{dE}{dx} \right)$$

Case IX  $\Rightarrow$  Force of interaction b/w two dipoles  $\rightarrow$

Method (1) Electric field at point A due to dipole (1)

$$E_1 = \frac{1}{4\pi\epsilon_0} \frac{2P_1}{r^3}$$

$$\frac{dE_1}{dr} = \frac{1}{4\pi\epsilon_0} \frac{(-6)P_1}{r^4}$$

\* Force acting on dipole (2)

$$F = P_2 \left( \frac{dE_1}{dr} \right) = -\frac{1}{4\pi\epsilon_0} \frac{6P_1P_2}{r^4}$$

NOTE  $\Rightarrow \frac{dE}{dr} \rightarrow \ominus$  ve  $\leftarrow$  sign indicates that force is attractive in nature.

Method (2) PE of Dipole (2) kept in electric field of dipole (1) is given by -

$$U = -P_2 \left( \frac{1}{4\pi\epsilon_0} \right) \frac{2P_1}{r^3}$$

$$\checkmark \text{ Force } = F = -\frac{dU}{dr} = -\frac{1}{4\pi\epsilon_0} \frac{6P_1P_2}{r^4}$$

Case X  $\Rightarrow$  Torque & potential energy (PE) of interaction b/w two dipoles  $\Rightarrow$

Torque acting on  $\vec{P}_2$  due to electric field of  $\vec{P}_1$

$$\vec{P}_1 = P_1 \hat{i}, \vec{E}_1 \text{ at distance } r \Rightarrow \vec{E}_1 = \frac{1}{4\pi\epsilon_0} \frac{2P_1}{r^3} \hat{i}$$

$$\vec{P}_2 = P_2 \hat{j} \quad \vec{\tau}_{P_2} = \vec{P}_2 \times \vec{E}_1 = \frac{1}{4\pi\epsilon_0} \frac{2P_1P_2}{r^3} (-\hat{k})$$

$$\vec{E}_1 \text{ at distance 'r'} \Rightarrow \vec{E}_2 = \frac{1}{4\pi\epsilon_0} \frac{2P_2}{r^3} (-\hat{j})$$

(due to  $\vec{P}_2$  at  $\vec{P}_1$ )

$$\vec{P}_1 = P_1 \hat{i}$$

$$\vec{\tau}_{P_1} = \vec{P}_1 \times \vec{E}_2 = \frac{1}{4\pi\epsilon_0} \frac{P_1P_2}{r^3} (-\hat{k})$$

# For General System of Dipoles interaction energy ( $U$ )  $\rightarrow$

$$U = -\frac{1}{4\pi\epsilon_0} \frac{2P_1 P_2}{r^3}$$

Electric field due to  $\vec{P}_1$  at point A

$$\vec{E}_{P_1} = \frac{1}{4\pi\epsilon_0} \frac{2P_1 \cos\theta_1}{r^3} \hat{i} - \frac{1}{4\pi\epsilon_0} \frac{P_1 \sin\theta_1}{r^3} \hat{j}$$

$$\vec{P}_2 = P_2 \cos\theta_2 \hat{i} + P_2 \sin\theta_2 \hat{j}$$

$$* U = -\vec{P}_2 \cdot \vec{E}_{P_1}$$

\*\*\*  
g  $\rightarrow$

If the shell is released from the position shown, then find -

|a|  $\rightarrow$  Initial Angular Accn. -

Initial torque

$$\vec{\tau}_i = \vec{P} \times \vec{E} = PE = I\alpha$$

$$I = \frac{2}{3} MR^2$$

$$\alpha = \frac{3PE}{2MR^2} = \frac{3EQR}{2MR^2} = \boxed{\frac{3EQ}{2MR}}$$

|b|  $\rightarrow$  Angular Speed when it rotated through  $\theta = 90^\circ$  \*

$$\boxed{\omega = \sqrt{\frac{2EQR}{I}}}$$
